Quality treatment:

- Homogeneous treatment.
- Excellent leaves covering
- It moves the leaves reaching everywhere

Main features:

- The spraying system generates **air-stream turbulence** and **atomizes the spraying drops**, producing a **cloud that reaches all parts of the plant**.
- The air is channelled through a pipe, so each nozzle has its own air pipe. This way we have an **homogeneous air curtain along side the complete height of the plant**.
- We can regulate the air of the turbine to choose the exact air flow to move the plants in order to reach the downside of the leaves.
- **We can regulate the nozzles flow and pressure as well as the air flow**. So we can determine exactly what type of spraying we apply to each pest and crop.
- **The nozzles and air pipes can be folded not exceeding 2 m height. The spraying height can reach 4 m.**
- **Totally homogeneous treatment**, from first to last plant, covering all its height.
- **High manoeuvrability**. Six-wheel drive and full 360° steering offers exceptional manoeuvrability and makes it much easier to drive efficiently into the greenhouse.
- **Easy and intuitive driving**, by means of an ergonomic joystick.
- **Operator safety**. Worker exposure to chemical is considerably reduced in comparison with traditional spraying methods.
