Araucaria is an application that allows you to build argument trees using its attractive user interface and state of the art features. Argument trees are often used to present an argument, or to analyze its structure. They are also useful as a notational device to present relationships. In Araucaria, you can construct argument trees using your own text, a library of arguments, and a number of schemes. In Araucaria, you may: ● Select a phrase as a premise and start building the tree ● Analyze the structure of your argument ● Manage properties of the nodes and arguments ● Save your work and export to a file Argument schemes are general ways to display or present an argument. In the Standard "box-and-arrow" scheme, each box and arrow encodes a single premise. These boxes have a title, a short summary of the premise, a long summary, and a list of supporting and critical questions. The Toulmin scheme is a general scheme for structured argument trees in which a body with a hierarchical structure is represented by a simple "bullet" shape, while each premise has a different shape. By using the standard node shapes in the blue panel, you may group together several nodes of the same type in order to make them easier to distinguish in a visual diagram. With the help of the graph editor, you may select one or several nodes of the argument tree and modify their properties. By drawing a line between nodes, you may connect them. You may create new nodes, or delete nodes or arguments. All your changes are saved, and can be imported to Araucaria at any time. If you don't like the default properties of an argument, you can save it as a Scheme, and apply that scheme to a new argument. You can choose from various schemes created by Araucaria users. Araucaria has many more tools. You can: ● Create and edit Scheme arguments ● Select arguments from a library of arguments ● Clone arguments and modify them ● Change a Scheme's structure ● Change a Scheme's style ● Delete an argument or a Scheme ● Add a Scheme argument ● Move a Scheme's arguments to another Scheme ● Compile an argument into an AML file In addition to that, Araucaria has many other tools. For example, you may: ● Cut and paste argument parts ● Set the argument's starting and ending text ● Display the full text
