size on disk, and typically let you perform a task in just a few lines, rapidly.

Settings such as as IDAT
size and quality have an

effect on output quality. The larger the IDAT size, the higher the quality. A large IDAT size also means less memory is required to compress and decompress the image. If a preset has not been selected, the tool will attempt to guess the correct settings from the image data. Images must have a file format of PNG, BMP or JPG. The output file format is PNG, BMP

or JPG, with a maximum of 256 colors per color type. Image files with embedded PNGs can be processed, but they are not optimized. The quality can be set from 0 to 100. The compression factor can be set from 1 to 9. The function of Pngcrush depends on the quality and compression factor. The speed is calculated as the percentage of the CPU

that the program has utilized. The speed is calculated in the idle state. If the output file contains errors, the Pngcrush program will be automatically terminated. Output: Output files are automatically saved to the current directory. If the output file has an extension of *.png, it will be saved to the specified directory. If it has no extension, it will be saved

to the current directory,
and a default extension
will be created. Usage:
