

To insert a clip, you would go to the Clipboard menu and select Clipboard. This will bring up the Clipboard dialog box. You'll then be able to select the place where you want your clip to go and press Paste. This will insert the clip into the file that is currently open. This is a great way to quickly add a picture to a document without having to cut and paste. You can access the Clipboard dialog box by pressing CTRL+V. The clip that you are pasting will automatically be saved into the New Document. This is a great feature that most programs lack. Photoshop has one of the best clipboards on the market.

The focus in this version seems to be in speed and performance. What this means is that the number of features have been cut down and the program is streamlined rather than sprawling out. This seems odd in fact, as this is the same software everyone loves for editing. But the newer versions are more streamlined, with a focus on speed, performance and ease of use. This is definitely the case with Lightroom. Even so, I experienced some major bugs in the latest few versions of Lightroom, as well as some performance issues. The most serious of these was when I checked the file size of certain images. Lightroom often showed me that they were over 300MB large and down-sampled versions showed up as if the original image is over a Gigabyte. The problem was that the file was not getting opened properly and I saw an error message if I tried to run a DNG or TIFF. So, I turned off auto-extending and the problems went away – until I turned it on, that is. Then I couldn't make changes. Time to call Adobe. For now, we can't be too upset about this. At least this is still the current version. We'll have to see how it develops further.
