SPSFarmReport Crack + Full Version Download

SPSFarmReport Cracked Version is a tool that queries an SPS 2007 or 3.0 farm and returns the topology information in an HTML table. You can configure the following settings in this report: - the type of information you want to gather: Web Applications, SPSInstalled, Farm, or Farm2Web Applications. - the location of the report file - the time to collect data. - a list of

environment variables to be used in the report. We will see in the report how many servers are in the farm, what services are running on each server, where the Central Administration web site is located, the default SSP in the farm, the URL of the Central Administration site of the default SSP, the My Site provider of the default SSP and the URL of the My Site provider.

SPSFarmReport Crack does not run the services, does not change the environment, and does not take a long time to run.

SPSFarmReport Torrent

Download Features: - Detect and gather information about the farm you are troubleshooting. - A

HTML page is created that summarizes the information gathered. - There are hyperlinks in the HTML page to launch the services and get details about each. - A treeview on the report page enables you to drill down and get more details. - The report is saved in a specified location. - The report is saved under an.htm,.html,.asp or.aspx format. The default is.htm. - This report can be configured to run in two modes, gather status information or gather detail information. - This report uses information that is available in your SharePoint environment. - A lot of information is gathered about your SharePoint farm and saved

in the report file. - Information can be exported to a text file. - Results of the report can be viewed in the browser. - Each report run is timed for 15 minutes and the report is saved in a folder with the current date. - The folder where the report is saved can be specified by an environment variable. - SPSFarmReport collects the following information: - Number of servers in the farm. - Type of services run on each server. - The location of the Central Administration web site. - The default SSP in the farm. - The URL of the Central Administration site of the default SSP. - The My Site provider of

the default SSP. - The URL of the My Site provider

SPSFarmReport With Serial Key Download PC/Windows

- The Managed Account in the Farm: the account that is used to authenticate against your farm. This account is configured by the Farm administrator in Central Administration. - Default SharePoint Server: the server that is used as a Query/Indexer by default, unless you configured a different SSP. - Farm SSP: the server that is used to host the Central Administration site. - Farm Website: the URL of the default SharePoint web

application in the farm. - Farm Web Application: the Web application that is associated with the default SharePoint web application. - Farm Applications: the Web applications that are associated with a specific SharePoint web application. - Farm Web Applications: the Web applications that are associated with a specific SharePoint web application. - Application Pools: the application pools that are associated with the Web applications in the farm. - Application Pools: the application pools that are associated with the Web applications in the farm. - Farm Content Databases: the content databases that are

associated with the Web applications in the farm. - SharePoint Content Databases: the content databases that are associated with the Web applications in the farm. - App Pool Account: the account that is used to run an application pool. - App Pool Account: the account that is used to run an application pool. - Tenant Information: The URL of the default site collection of the tenant that is associated with the managed account. - Default Tenant Collection: The default site collection that belongs to the tenant that is associated with the managed account. - Default Tenant Site: The default site collection that

belongs to the tenant that is associated with the managed account. - Managed Account: The account that is used to authenticate against your farm. This account is configured by the Farm administrator in Central Administration. - SharePoint Web Application: The URL of the default SharePoint web application in the farm. - SharePoint Web Application: The Web application that is associated with the default SharePoint web application. - Farm Web Application: The Web application that is associated with the default SharePoint web application. - SharePoint Web Application: The Web application

that is associated with the default SharePoint web application. - Tenant Web Application: The URL of the Web application that is used as a portal for the tenant that is associated with the managed account. - Tenant Web Application: The Web application that is associated with the tenant that is associated with the managed account. 2edc1e01e8

The Windows SharePoint Services (SPS) version that has been installed on each of the servers in the farm is used to determine the farm topology. The data is collected by the SPSfarmReport application and it can be run on each of the servers in the farm to get the information you require. The information that can be gathered is stored in a SQL Server database which can then be downloaded and used to populate custom reporting pages. The following services are queried for a farm and the results stored in a SQL Server database: Server farm name SQL

logins User accounts Application
pools Application pool
configuration Web applications
Site collections Publication
configurations Custom
application associations Web
parts Stored procedures The
Farm will always be running
SPSFarm. It is possible for you to
have 2 or more running and for
the report to only include one.
This occurs if you run 2 SPSFarm
Reports in parallel. The
information will still be the same
between the two as they are
pulling information from the
same database. I wrote this tool
as a tool for myself to collect all
the information about farm
topologies that I often need and

want to share with Support to help them troubleshoot better. The download includes the following: - SPSfarmReport database - SPSfarmReport application as a.exe (Sourcecode included) - Web pages to display the reports - The application (web application) and service scoped security policy manifest files - A VSPackage to run the report

Installation: Download the file spsfarmreport.zip from the Download page. Unzip the file. Open the Start Menu. Right-click the Start Menu. Choose Run. Type

```
%windir%\system32\inetsrv\appcmd.exe /SPSfarm
```

and press ENTER. The following messages

will be displayed: "Type 'abort' to cancel this operation."

"Processing configuration change 'farm'. "/appcmd.exe" - c: -

Config: - FailoverScriptPath:

"C:\Program Files\SharePoint Foundation\Config\Farm.Config

Processing configuration change 'farm'. "/appcmd.exe" - c: -

Config: - WebPublishingPath:

"C:\Program Files\SharePoint Foundation\Config\Farm.WebPub

* You can specify the environment to fetch farm related information from * You can specify the farm and web application to fetch information from * You can specify what level of detail to gather information from * You can specify what type of servers to look up and gather information from * No server is required to be online to be retrieved information from the SPSFarmReport tool * The SPSFarmReport tool generates a working report in Microsoft Word that can be sent to support The SPSFarmReport was designed to be a tool that can be

used to gather farm related information on environments where Windows SharePoint Services 3.0 or Office SharePoint Server 2007 is installed. The very purpose of this tool is to help folks in Support understand the topologies deployed in SharePoint environments they troubleshoot. This is not an error reporting tool and does not make any change in the environment. The tool makes use of the SharePoint Object Model to query farm-related information. Some very basic information about the Farm topology is gathered. We have some common questions asked when working through a support incident.

These questions include: - How many servers exist in the farm? - What services are run by each server in your farm? Which server is the Query/Indexer? - Which server(s) host(s) the Central Administration web site in the farm? - How many SSPs exist in the farm? - Which is the default SSP in the farm? - What Web applications are associated with each SSP? - Which application pool is associated with each web application in the farm? - What AAMs are configured for each web application? - What Microsoft Office or SharePoint-specific accounts are associated with each web application in the

farm? - What file system permissions do you want on each content database? - How many content databases are associated with each web application and how many site collections does each have? - What AAMs are configured for each web application? - Which application pool is associated with each web application in the farm? - Which is the default app pool associated with each web application? - What kind of mail feature is enabled for the web application? - Which mailbox is associated with the default Web application in the farm? - What e-mail address do you want for the SharePoint account used to

administer this Web application?
- What user permissions are you granting to the default SharePoint user? - Which Microsoft Office or SharePoint-specific accounts are associated with each web application in the farm? - How many databases are configured for each web application in the farm? - What database role does each database server run? - Which databases are associated with each web application in the farm? - How many web application databases exist in the farm? - What is the size of the largest database? - What is
